No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      B B

Title: Perfect score: Sequence: US-09-104-340-4
1466
1 MDCQLSILLLLSCSVLDSFG......VPIGKCSCNAGYEERGEMCQ 271

Scoring table: BLOSUM62 Gapop 10.0 , Gapext 0.5

Searched:

188963 seqs, 23686106 residues

Total number of hits satisfying chosen parameters:

188963

Minimum DB seq length: 0
Maximum DB seq length: 1000000

Post-processing: Minimum Match 0% Listing first 45 summaries

Database : A_Geneseq_36:*

Pred. No. 1s the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Probes derived from the EPH-related PTKs Cek4 (Q90659) and Ce (Q90660) were used to isolate novel cDNA clones (Q90652-58, Q90661-62) from chicken embryo and embryonic brain libraries. Cek4 is highly expressed in the chicken developing brain and embryonic tissues and also in the adult brain and retina. Sequence 983 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              production and/or function analogues have activity in cellular responses such as Sequence 983 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        N-PSDB; T03100.

Agonist antibodies which activate specific protein tyrosine Agonist antibodies which activate proteins of kinase extracellular kinase(s) - also activate chimeric proteins of kinase extracellular domain and Ig constant domain, useful for studying, and therapeutic modulation of, cell growth and differentiation modulation of, cell growth and differentiation Disclosure; Page 95-99; 125pp; English PTK, sequences were used to screen cDNA libraries to identify novel pTK genes. The bpTKs, DpTK1, bpTK2, bpTK3, bpTK4, bpTK5 and bpTK7 (R85924-28 and R85935, respectively) are expressed in human brain tissue and show homology to known pTKs. A full-length sequence for bpTK7 (R85936) was also obtd. bpTK7 can be used to design drugs that modulate pTK activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   obtd. by

Mouse Bsk receptor-like tyrosine kinase, brain; diagnosis; neoplasm neurodegenerative disease; limbic system neuron regeneration; chromosomal abnormality, degenerative growth; development disorder; chromosomal abnormality, degenerative growth; development disorder; chromosomal abnormality, all pheimer's disease; epilepsy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           4 Novel human EPH-like receptor protein tyrosine kinases, HEK5, HEK7, HEK8 and HEK11 (R85089-92), respectively, were identified following isolation of their encoding cDNAs (T02946-49) from a human foetal braccon library. :HEK5, HEK7 and HEK8 show extensive homology to the catalytic domain of chicken EPH-like receptors Cek5, Cek7 and Cek8. HEK11 shows no homology to any known EPH-like receptor. Recombinant HEK receptors (or their soluble extracellular domains) are produced to expression of encoding sequences in procaryotic or eucaryotic host cells, and are used to produce antibodies (utilised in diagnostic assays), or to identify and purify ligands for HEK receptors, or therepeutically to modulate the activation of cell-associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New nucleic acid encoding EPH-like receptor tyrosine kinase(s) and related vectors, host cells, proteins, antibodies etc., us diagnostically and therapeutically to modulate receptor activa

PS Claim 1; Fig 2; 72pp; English.

CC The present sequence represents mouse Bsk, which is a receptor-like CC The present sequence represents mouse Bsk which is a receptor-like CC tyrosine kinase. The nucleic acid sequence encoding Bsk can be used in CC Bsk nucleic acid probes, which can be used in detecting alterations in CC the level of Bsk messenger-RNA (mRNA) in biological samples isolated CC from a mammal afflicted with a disease, such as neurodegenerative CC diseases or disorders and neoplasms. The nucleic acid sequence can also CC be delivered into the limbic system of patients with limbic system CC neurodegenerative disease, disorder or injury, to promote or enhance CC neurodegenerative disease, disorder or injury, to promote or enhance CC diseases include, chromosomal abnormalities, degenerative growth and CC development disorders, viral infections, bacterial infections, brain CC injuries, neoplastic conditions, Alzheimer's disease, epilepsy, SQ Sequence 877 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   δÃ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     밁

Example 1: Page 50-53; 75pp: English.

Rat REK7 (R97853) is an eph-related tyrosine kinase receptor, for which AL-1 (see also W97854) is a ligand. Its amino acid sequence was deduced from a cDNA clone (R18893) isolated from a hippocampal cDNA library. An REK-IGG fusion was used to screen cultured cell lines for surface expression of REK7-binding activity. Primers (see also T44382-83) based on peptide sequences (R97856-59) of isolated ligands were used to amplify human breast carcinoma BT20 cell cDNA, and an amplified fragment was used to screen a human foetal brain cDNA library, leading to the isolation of AL-1 cDNA related:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          26-OCT-1995; U14016.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        S
                                                                                                                                                                                                                                                                               4 Novel human EPH-like receptor protein tyrosine kinases, HEK5, HEK7, CHEK8 and HEK11 (R85089-92), respectively, were identified following isolation of their encoding cDNAs (T02946-49) from a human foetal brain CDNA library. HEK5, HEK7 and HEK8 show extensive homology to the catalytic domain of chicken EPH-like receptors Cek5, Cek7 and Cek8. HEK11 shows no homology to any known EPH-like receptor. Recombinant HEK receptors (or their soluble extracellular domains) are produced by expression of encoding sequences in procaryotic or eucaryotic host cells, and are used to produce antibodies (utilised in diagnostic assays), or to identify and purify ligands for HEK receptors, or therapeutically to modulate the activation of cell-associated proliferation and/or differentiation of brain cells.
                                                                                                                                                              Query Match

Claim 18; Page 71-75; 133pp; English.

CL 4 Novel human EPH-like receptor protein tyrosine kinases, HEK5, HEK7,

CC 4 Novel human EPH-like receptor protein tyrosine kinases, HEK5, HEK7,

CC 4 Novel human EPH-like receptors protein tyrosine kinases, HEK7,

CC HEK8 and HEK11 (R85089-92), respectively, were identified following

CC isolation of their encoding cDNAs (T02946-49) from a human foetal brain

CC CDNA library. HEK5, HEK7 and HEK8 show extensive homology to the

CC catalytic domain of chicken EPH-like receptors Cek5, Cek7 and Cek8.

CC HEK11 shows no homology to any known EPH-like receptor. Recombinant

CC HEK receptors (or their soluble extracellular domains) are produced by

CC expression of encoding sequences in procaryotic or encaryotic host

CC cells, and are used to produce antibodies (utilised in diagnostic

CC assays), or to identify and purify ligands for HEK receptors, or

CC therapeutically to modulate the activation of cell-associated
                                                                                                                                                                                                                                                                                                                                                    Query Match

CDNA cloning using adult mouse brains and Northern blotting identified 2 truncated versions, MDK1 T1 (W03422) and MDK1 T2 (W03423), of the novel mouse developmental kinase 1 (MDK1) (see als W03423), a new member of the eck/eph family of receptor tyrosine kinases. Their amino acid sequences were deduced from cDNA clones (T32961 and T32962) obtd. from adult mouse brains. MDK T1 and T2 each possess the entire ectodomain, the transmembrane domain and part of the juxtamembrane region of MDK1, but lack the catalytic tyrosine kinase domain. They can be used to screen for potential agents useful for treatment of diseases characterised by abnormal signal transduction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (SUGE-) SUGEN INC.

Example 1; Page 113-115; 128pp; English.

CDNA cloning using adult mouse brains and Northern blotting identified 2 truncated versions, MDKI TI (W03422) and MDKI T2 (W03422), of the novel mouse developmental kinase 1 (MDKI) (see als W03421), a new member of the eck/eph family of receptor tyrosine kinases. Their amino acid sequences were deduced from cDNA clones (T32961) and T32962) obtd. from adult mouse brains. MDK TI and T2 each possess the entire ectodomain, the transmembrane domain and part of the juxtamembrane region of MDKI, but lack the catalytic tyrosine kinase domain. They can be used to screen for potential

20 Mouse developmental kinase 1 (MDK1) (W03421) is a new member of the ceck/eph family of receptor tyrosine kinases (RTKS). Its amino acid sequence was deduced from a cDNA clone (T32960) isolated from mouse embryo and adult brain libraries. The distinct patterns of MDK1 expression during mouse development suggest an important role for MDK1 in the formation of neuronal structures.

21 MDK1 may be obtd. by expression in host cells. It can be used in methods for the diagnosis of diseases characterised by abnormality in a signal transduction pathway, such as neuroproliferative or neurodegenerative disorders or cancer, to screen for (ant)agonists, and to raise antibodies.
                                                                                                                                                                                                                                                                                                                diagnosis and treatment pathways

N-PSDB; Q90657.

Eph-related protein tyrosine kinase(s) - for monitoring and diagnosing cancer.

Claim 11; Page 71-75; 129pp; English.

A cDNA clone encoding a novel variant of EPH-related PTK Cek5,

Cek5+ (Q90657), was isolated from a chick embryo library in lambda gtll. Cek5+ protein (R75709) contains a 16-amino acid insertion in the juxtamembrane domain, and be a result of alternative splicing. Cek5+ is exclusively expressed in the CNS. Sequence 1011 AA;
                                                                                                                                              148

Batrachia;
                                                                                                                                                                                                                    -I- FUNCTION: RECEPTOR FOR MEMBERS OF THE EPHRIN-A FAMILY (BY SIMILARITY). MAY PLAY A ROLE IN THE DIFFERENTIATION OF CRANIAL NEURAL CREST AND OTHER TISSUES.
-I- CATALYTIC ACTIVITY: ATP + A PROTEIN TYROSINE = ADP + PROTEIN TYROSINE PHOSPHATE.
-I- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
-I- TISSUE SPECIFICITY: LOCALIZED EXPRESSION IN A SUBSET OF NEURAL CREST AND NEURAL TISSUES IN EMBRYOS.
-I- DEVELOPMENTAL STAGE: PRESENT TRANSIENTLY IN VISCERAL ARCH 3. ALSO EXPRESSED IN THE FOREBRAIN, RHOMBOMERES R3 AND R5 OF THE HINDBRAIN AND IN THE PRONEPHROS.
-I- SIMILARITY: CONTAINS 1 IMMUNOGLOBULIN-LIKE C2-TYPE DOMAIN.
-I- SIMILARITY: CONTAINS 2 FIBRONECTIN TYPE III-LIKE DOMAINS.
-I- SIMILARITY: TO OTHER PROTEIN-TYROSINE KINASES IN THE CATALYTIC DOMAIN BEYONGS TO THE FEBRUARY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Xenopus.

SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.

TISSUE SPECIFICITY: WITHIN THE NERVOUS SYSTEM, EXPRESSION IS TISSUE SPECIFICITY: WITHIN THE NERVOUS SYSTEM, EXPRESSION IS RESTRICTED TO PROSOMERES I AND 2 IN THE DIENCEPHALON AND ALL THE RHOMBOMERES IN THE HINDBRAIN DURING SEGMENTATION STAGES. LATER ON, A SUPERLINGSED PATTERN APPEARS THAT CORRELATES WITH THE FORMATION OF SEVERAL AXONAL TRACTS. IN THE SOMITIC MESODERM, THE EXPRESSION OF SEVERAL AXONAL TRACTS. IN THE GUIDANCE OF BOTH NEURAL CREST AND MOTOR AXONS THROUGH THE SCLEROTOMES.

-!- DEVELOPMENTAL STAGE: MATERNALLY EXPRESSED, IT DECREASES AT MID BLASTULA TRANSITION AND REAPPEARS AT LATE NEURULATION. EXPRESSED AT HIGHER LEVELS IN THE ANTERIOR AND DORSAL REGIONS OF EMBRYONIC STAGES 16, 24 AND 37. IN ADULT IT APPEARS TO BE UBIQUITOUSLY EXPRESSED WITH HIGHER EXPRESSION IN BRAIN AND OVARY. EXPRESSION ITHE BRAIN, BRACHIAL ARCHES, TRIGEMINAL FACIAL GANGLION, AND THE RETINA OF SWIMMING TADPOLE STAGE OF DEVELOPMENT.
-!- SIMILARITY: TO OTHER PROTEIN-TYROSINE KINASES IN THE CATALLYIC DOMAIN. BELONGS TO THE EPHRIN RECEPTOR FAMILY.
-!- SIMILARITY: CONTAINS 1 IMMUNOGLOBULIN-LIKE C2-TYPE DOMAIN.
-!- SIMILARITY: CONTAINS 2 FIBRONECTIN TYPE III-LIKE DOMAINS.

TYROSINE PHOSPHATE.
-I- SUBCELJULAR LOCATION: TYPE I MEMBRANE PROTEIN.
-I- TISSUE SPECIFICITY: EXPRESSED IN THE EMBRYO IN PRE-SOMITIC
MESODERM, CAUDAL SOMITES, MIDBRAIN, AND CEMENT GLAND. MOST
ABUNDANT IN ADULT BRAIN, EYE, HEART, LUNG AND OVARY. LOWER LEVELS
IN INTESTINE, KIDNEY, OVLDUCT AND PHARYNX.
-I- DEVELOPMENTAL STAGE: EXPRESSED DURING EARLY DEVELOPMENT.
-I- SIMILARITY: COTTAINS 1 INMUNOGLOBULIN-LIKE C2-TYPE DOMAIN.
-I- SIMILARITY: CONTAINS 2 FIBRONECTIN TYPE III-LIKE DOMAINS.
